Information is Your Key to Success

In an increasing competitive business environment, the availability and access of information is the differentiator to your success. With the proliferation of the Internet, organizations need to quickly deploy communities, resource centres in their Intranets, Extranets and share resources and vital information.

Users of these portals are authenticated with a single sign-on across multiple applications to provide secured access to these business applications and their sensitive data.

Each portal user views their content with a personalized layout. Such personalised pages are assembled from portlets. In a portal, you can rapidly find and share information among multiple applications. Personalised pages empower each portal user to organize the information the way they want to view it.

Web Portal Server

Brel Web-CMS Portal Server provides quick deployment of portal solutions with sophisticated capabilities for smart organisations.

Communities

Communities are Resource Centres that bring together various portal users to share information with its members. Marshall Cavendish develop a secured members' only community portal where teachers have access to valuable teaching resources.

Personalisation

A portal user can personalise his view of content and applications aggregated by the portal. Personalised pages are aggregated from selected portlets. A Profile Manager keeps each portal user's preferences, layout and profile.

Portlets

Brel Web-CMS Portal Server supports different types of portlets namely Static, URI based, ISR 168 and custom defined Portlets. Portlet can for example, extracts key customer information from the Corporate CRM application database.

Access Control System

A User Access Control System (ACS) authenticates each portal user and also ensures controlled access to vital information. Roles can be defined to restrict what activities each user can perform.

Single Sign-On

Brel Web-CMS Portal Single Sign-On (SSO) provides single log-in to the portal itself and also to other systems that the portal integrates to. The SSO capability is designed to inter-operate with the securities of other systems like LDAP directories.
